US516P6 offline voice assistant

I came across this part in my Google news feed the other day:

<https://www.cnx-software.com/2021/08/17/offline-speech-recognition-mcu-module-comes-with-speaker-microphone-and-uart-connectors/?amp=1>

I haven't been able to find any documentation in English.

Has anyone successfully used this part? If so would you be willing to share how you got it to work? I would love to get local speech detection working with an ESP32!

I'd almost recommend using a Pi. Google's offline voice library is really good.

\$2 vs \$75... Hmm.
